We present an overview of the techniques used for nonlinear time series analysis, to detect nontrivial structures in such time series data that will indicate the nature of underlying dynamics that produce the data. We start with the method of time delay embedding that can be used to re-construct the dynamics in higher dimension.

In this book, the basic methods of nonlinear analysis are emphasized and illustrated in simple examples. Every considered method is motivated, explained in a general form but in the simplest possible abstract framework. Its applications are shown, particularly to boundary value problems for elementary ordinary or partial differential equations.
