Orthographic projection is the solution to the biggest problem that a draughtsman has to solve—how to draw, with sufficient clarity, a three-dimensional object on a two-dimensional piece of paper The drawing must show quite clearly the detailed outlines of all the faces and these outlines must be fully dimensioned If the object is very simple, this may be achieved with a freehand sketch.

The development of the hexagonal prism is projected directly from the F.E. and the development of the square prism is projected directly from the plan. Projecting from the orthographic views provides much of the information required to develop the prisms, any other information can be found on one of the orthographic views and transferred to the ...

As a semiregular (or uniform) polyhedron. If faces are all regular, the pentagonal prism is a semiregular polyhedron, more generally, a uniform polyhedron, and the third in an infinite set of prisms formed by square sides and two regular polygon caps.It can be seen as a truncated pentagonal hosohedron, represented by Schläfli symbol t{2,5}. Alternately it can be seen as the Cartesian product ...
